Damage Calculation

Attacks deal a minimum of 10 damage BEFORE type effectiveness is considered.

When calculating not very effective damage, always round UP to the nearest 5.

Most attack effects with random chances are calculated for each individual target, meaning Flamethrower might burn one target but not another. Attacks with variable damage based on a rolled die, however, are calculated once and then applied to every target.

Attack and defense boosts raise or lower damage taken or given by 20, before type effectiveness.

Status Conditions

When a pokemon is poisoned, it takes 20 damage at the end of its move each turn. Poison and steel types cannot be poisoned. When a pokemon is badly poisoned, they take 20 extra damage each turn, starting with 20 damage on the first turn.

When a pokemon is burned, it takes 20 damage at the end of its move each turn. It also deals 30 less damage per attack. Fire types cannot be burned.

When a pokemon is paralyzed, it loses 1 movement speed, and it has a 20 percent chance of not being able to move or attack each turn.

When a pokemon is asleep or frozen, it cannot move or attack. At the beginning of a player's turn, they roll a die to see if each asleep or frozen pokemon will awaken or thaw. If it is a 5 or 6, they are freed from their status condition and can move as usual immediately.

Damage from status conditions are unaffected by stat boosts.

Map Features

Attacks can be launched from the trebuchet in the middle of the map. They have a base damage of 40, and take one of the types of the pokemon using it. Attacks hit any single pokemon anywhere on the map. They ignore stat boosts but not abilities.

Cannons are similar to trebuchets, but deal 60 damage of one of the types of the pokemon using it, and cannot attack anywhere on the map. Instead, they attack in a straight line until they reach a non-traversable tile such as water or a wall, hitting all pokemon on that line.

Wooden logs move one tile back when hit by a pokemon, in the direction that the pokemon aimed the attack in. When they hit a pokemon, they deal a flat 30 damage, ignoring any stat

changes and abilities, and then get destroyed. No pokemon can stand on a tile that is occupied by a wooden log, but flying types and ghost types can move through them.

When a pokemon walks through, lands on, or is hit into spikes, they take a flat 30 damage, regardless of stat changes or abilities. The pokemon take damage every turn they stay on the spikes. Flying types are immune to spikes.
When a pokemon walks through, lands on, or is hit into sticky webs, their speed gets lowered by one stage. If a pokemon stays on the sticky webs their speed gets lowered every turn they stay on the sticky webs. Flying types are immune to sticky webs.

Substitutes cannot be moved through by any pokemon except for ghost types. No pokemon can land on top of them. Any attacks that target substitutes will fail to target any other pokemon, even if they are in range of the attack. Substitutes will break after being hit.

Hazards cannot be placed directly on the trebuchet, but can land on any other occupiable tile.

Water tiles are only accessible by water and flying/levitating pokemon.

Magma tiles are only accessible by fire and flying/levitating pokemon.

When a pokemon walks onto ice, they slide forwards until they reach a non-ice tile, or collide with another pokemon or a wall. They are unable to use any more of their movement after this, but they can attack. Ice and flying/levitating pokemon ignore the effects of ice.

Pitch black tiles are pits. Flying types/levitating pokemon can move through them but cannot land on them.

Ability Information

Abilities like liquid voice that reference copying moves, do so immediately after the other pokemon uses the original attack. The pokemon with the ability can then attack in any direction. This ability does nothing if there is a move that must target other pokemon but no other pokemon in range.

Attack Information

Moves that target other pokemon must at least target one pokemon to be used.

If the only target is immune to an attack, the secondary effects of the attack do not activate.

Moves that reference adjacency are referring to the spaces directly next to the pokemon, including diagonally.

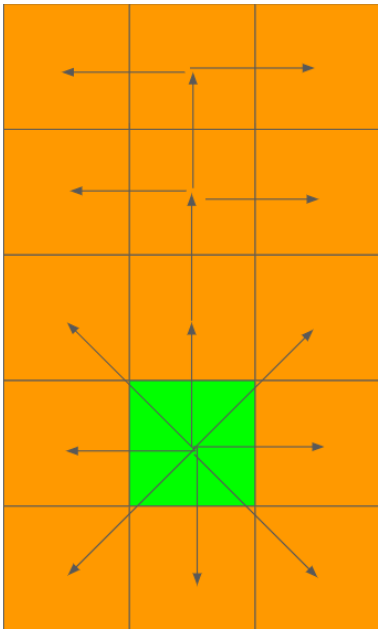

Moves that refer to stat boosts are specifically referencing POSITIVE stat changes.

Moves that graze are NOT affected by attack boosts OR defense debuffs.

Moves that reference “normal” terrain refer to terrain with no terrain bonuses (defense or healing), and no limitations on movement (No water, magma, ice, etc.)

Follow me only affects pokemon who are able to directly attack the user, and doesn't affect pokemon who can only attack the user using the trebuchet or other stage hazards. A pokemon who is affected by follow me is still allowed to attack the user using the trebuchet, however.

Future sight’s damage activates at the start of the player’s turn, not when they decide to move the pokemon who used the attack.

This diagram shows the direction that each attack tile comes from when a pokemon targets that tile. If a tile gets blocked by a wall, all tiles that it points to also get blocked.
